An interpretation is hereby requested for Florida Rule 9B.0472, Carbon Monoxide Protection as it is intended to be applied to a specific building. This request is submitted at the suggestion of the City of Jacksonville, Florida, Tom Goldsbury, CBO.

The facility in question is a four-story, (183) apartment unit senior housing project known as the Sweetwater Senior Housing Project. The total facility area, including all floors, is 208,000s.f. However, the entire facility is actually comprised of three "buildings", as the "buildings" are defined by Fire Walls with structural integrity separating the different "buildings", one from another. The fossil fueled appliances included in this facility are located in the central and north "buildings" in the following locations (There are no fossil fueled appliances located the south "building"):

- Gas Fireplace in the central entry lobby Central Building
- Gas boiler in a central mechanical room North Building
- Gas cooking appliances in a central kitchen North Building

SPECIFIC QUESTION:

Is it the intent of Rule 9B.0472 to require CO detection within 10' of all sleeping rooms throughout this entire facility, when the fossil fueled appliances are centrally and remotely located several hundred feet and several stories from the apartment units?
