

FLORIDA SOLAR ENERGY CENTER

Creating Energy Independence Since 1975

***Impact of Energy-Efficiency
Parameters on Home Humidity***

Rob Vieira

Florida Solar Energy Center

A Research Institute of the University of Central Florida

Purpose

- ❖ Some energy efficiency measures only address sensible loads. As these measures are implemented
 - Can today's HVAC equipment maintain acceptable humidity levels?
- ❖ Are there some key efficiency measures that could improve humidity in homes that implement sensible load reduction strategies?

Terms

- ❖ Sensible: Heat
- ❖ Latent: Moisture

Presentation Scope

- ❖ Single-family detached homes
 - Multi-family residences can often have less envelope sensible load due to fewer exposed surfaces but have not been the focus of many research studies – they are not covered in this presentation
- ❖ Existing studies that focus on humidity levels in homes

Parameters Studied

- ❖ *Efficient Windows (experimental & simulated)*
- ❖ *Various Efficiency Measures (simulated)*
- ❖ *Duct Leakage (experimental)*
- ❖ *HVAC Operations (experimental)*
- ❖ *HVAC Flow and Fan Operation (experimental)*
- ❖ *HVAC Time Delay Relay (experimental and simulated)*
- ❖ *Internal Loads*

Progress Energy Funded FSEC Study - 1999

*Site #198 - insulated double-pane
windows (4 of 170 homes)*

Influence of Windows on Heating and Cooling Energy and Demand

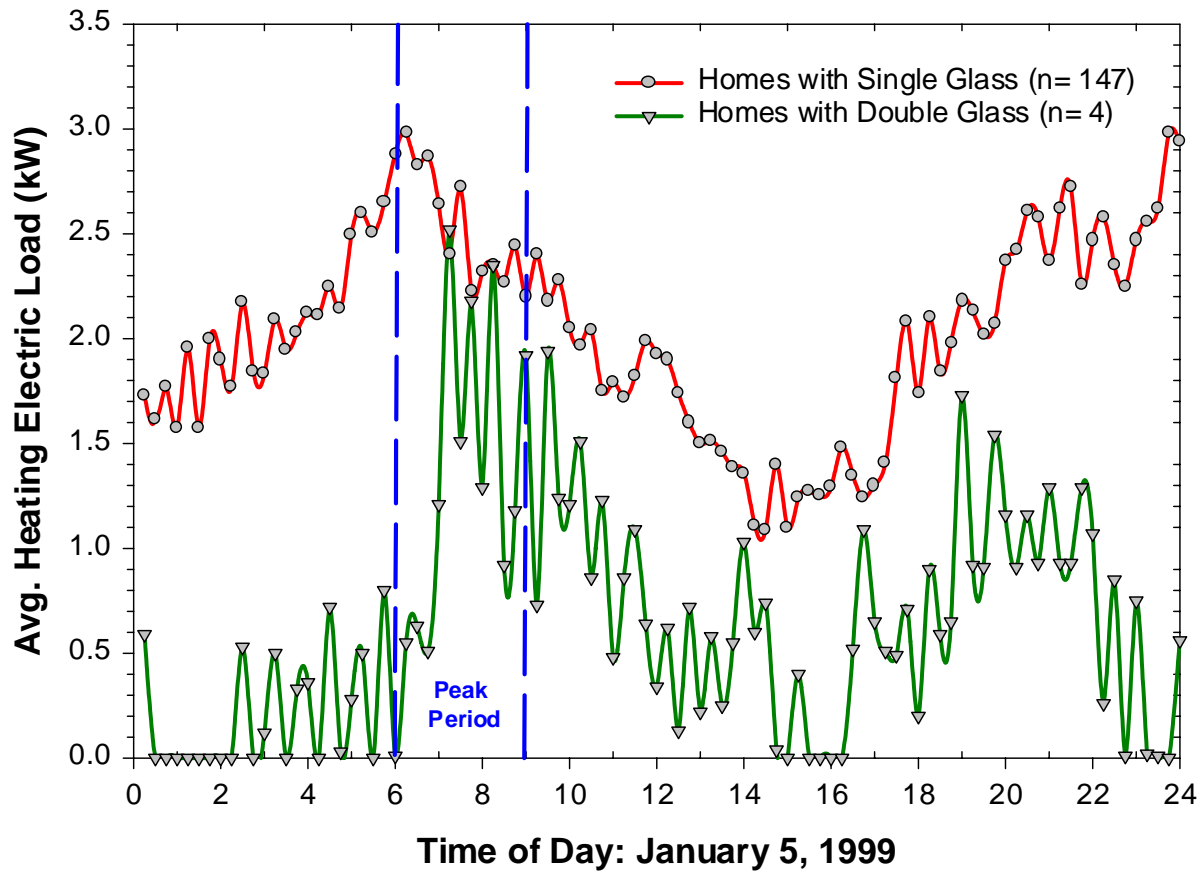

Case	Annual Heating	Annual Cooling	Peak Heating	Peak Cooling
Single Glass	1067	5754	2.60	2.93
Double Glass	485	3318	1.85	2.77

Note: Homes with all double glass: sites 23, 32, 110 and 198. There were 166 homes in the single glass sample.

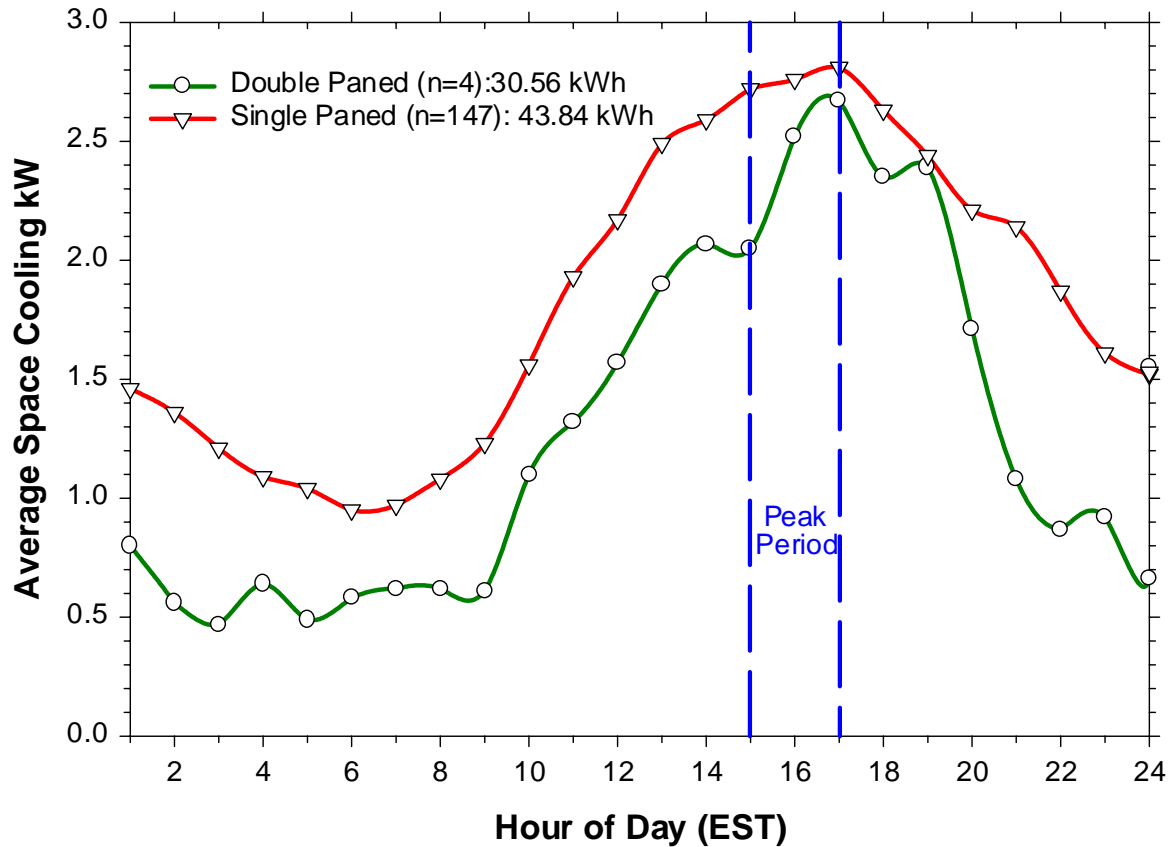

Influence of insulated glass for windows on peak winter day heating - Jan. 5, 1999

Peak summer day air conditioning demand profile - August 30, 1999

High Performance Windows – Mercedes Home Study

- ❖ Monitoring can answer direct and indirect questions
- ❖ What will they save?
 - Energy
 - Peak demand
- ❖ How will it impact interior humidity?

Base and Improved Window Specs Mercedes Homes Research Project

	Solar Heat Gain Coefficient	Winter Night U-Factor
Standard Single Pane Aluminum Windows	0.77	1.23
High Performance Windows - Spectrally Selective, Thermally broken	0.36	0.47

West facing window in the two test homes during a hot afternoon

Base

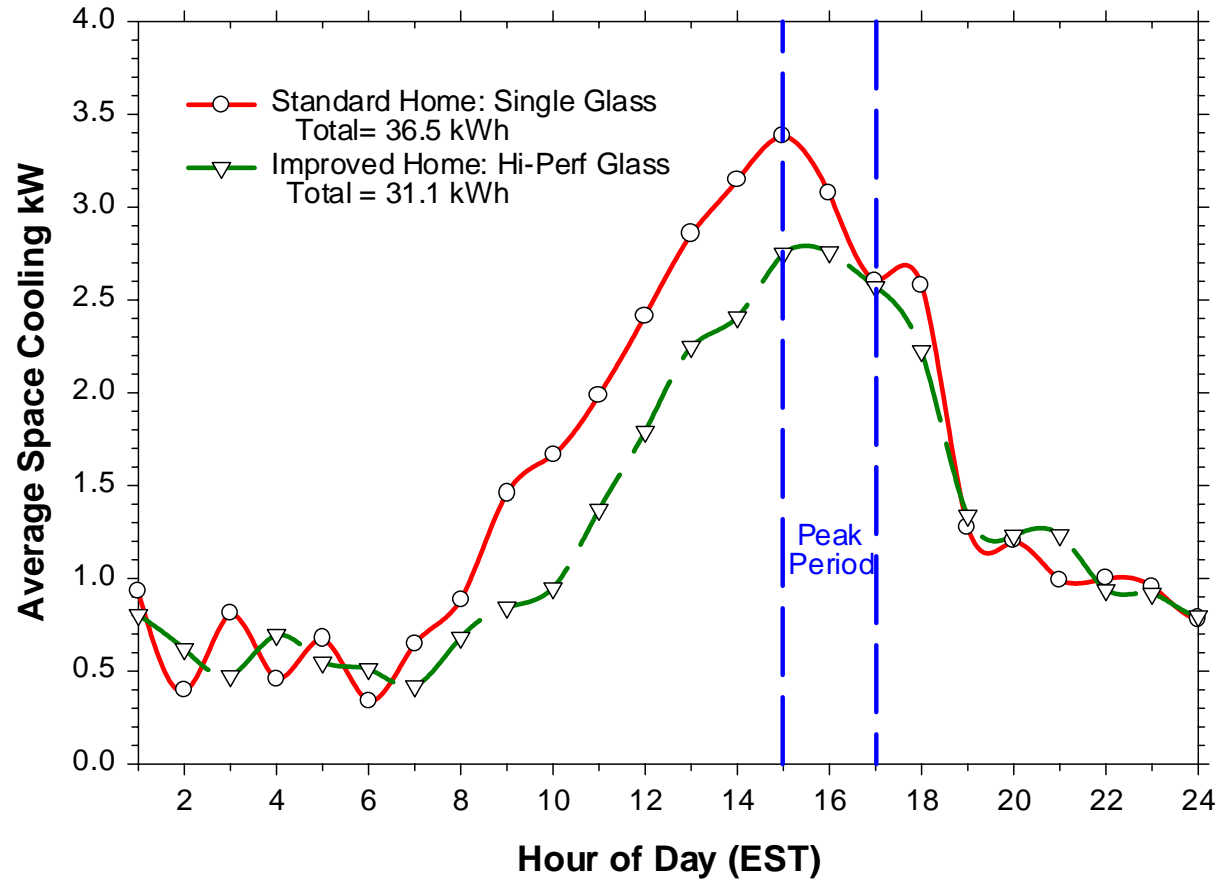

Improved

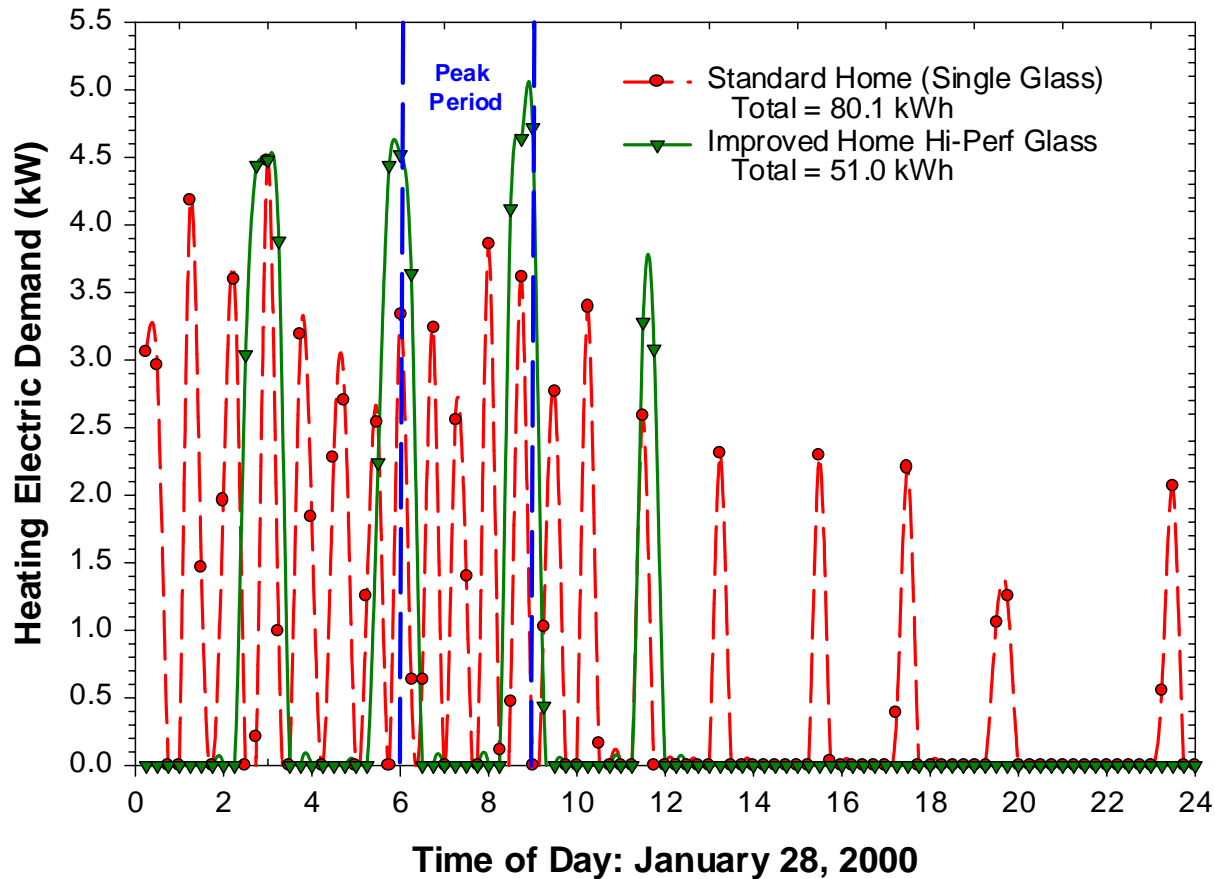

Comparative space cooling demand profile of two test homes over the hot 17-day period in Sept.

Comparative space heat demand profile on January 28, 2000. Morning low temperature was 43°F

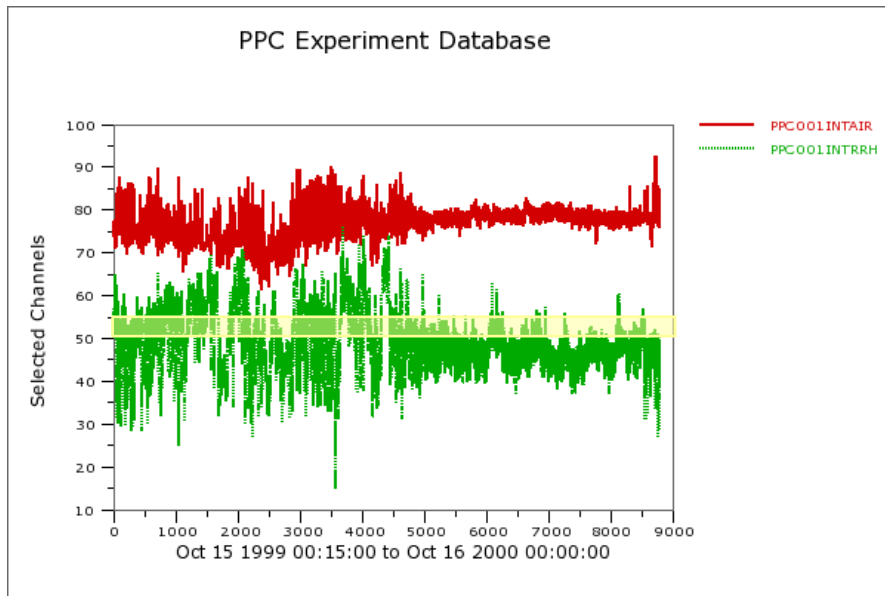

Annual Interior Temp & RH

Control

Experimental

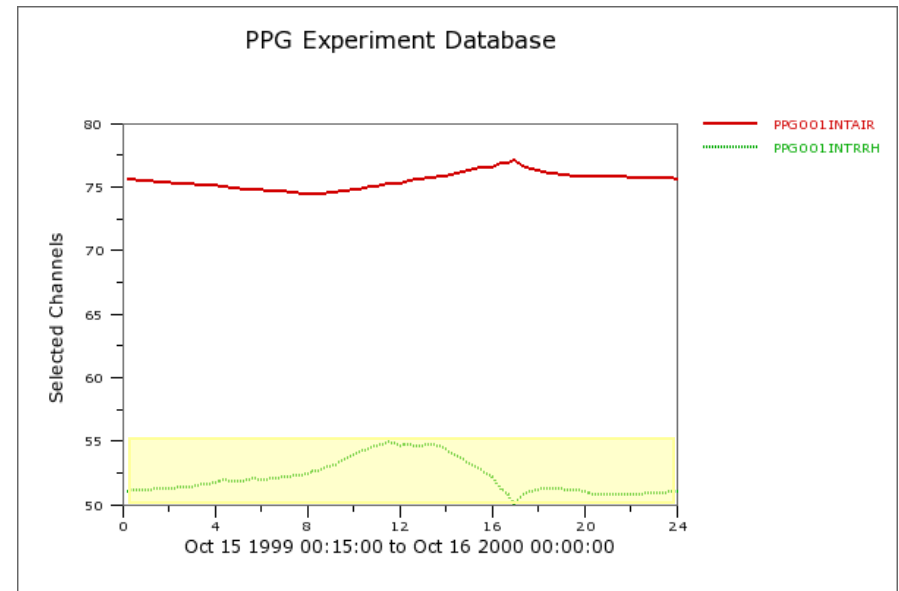

Annual Interior Temp & RH

Control, Single Glass: Avg Temp= 76.0 F, RH= 50.7%

Solar Control Glass: Avg Temp= 75.5 F, RH= 52.1%

Simulated Impact of Solar Control Windows

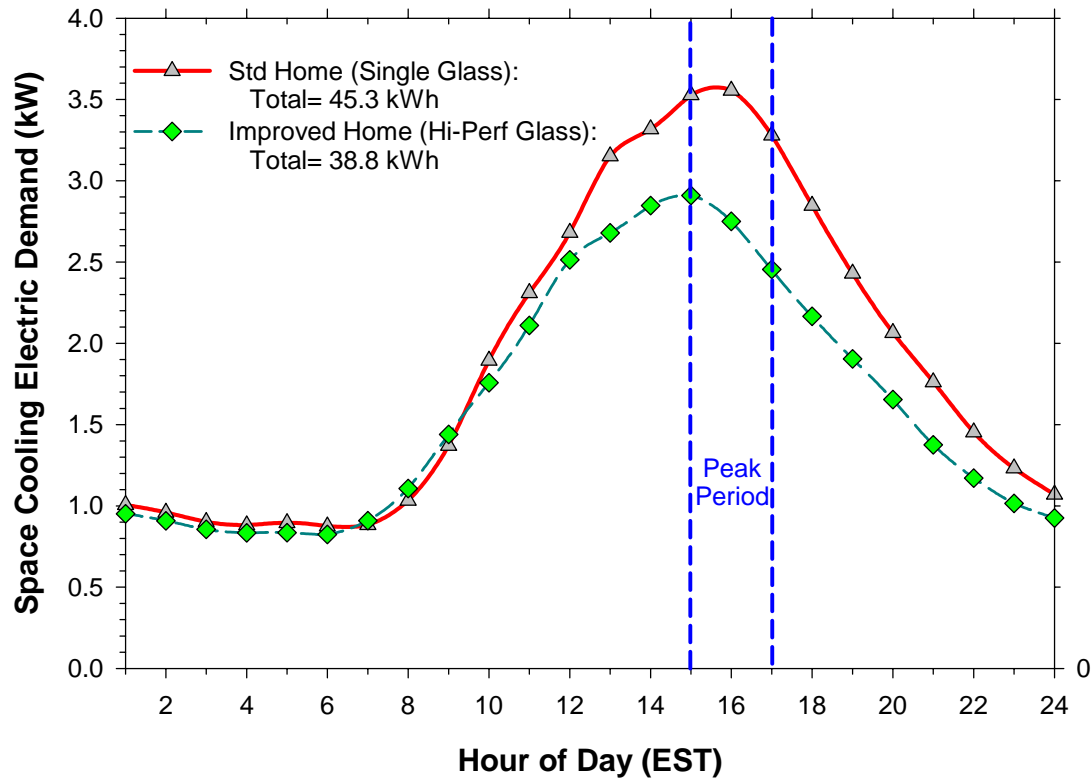

- ❖ 75 F set point in summer
- ❖ 72 F set point winter
- ❖ No change in AC size
- ❖ Annual average relative humidity
 - 41.6% Single Glass
 - 43.7% Solar Control Glass
 - 2% increase in interior RH
 - Similar to empirical study

 National Fenestration Rating Council CERTIFIED	World's Best Window Co. Millennium 2000 ⁺ Vinyl-Clad Wood Frame Double Glazing • Argon Fill • Low E Product Type: Vertical Slider
ENERGY PERFORMANCE RATINGS	
U-Factor (U.S./I-P) 0.35	Solar Heat Gain Coefficient 0.32
ADDITIONAL PERFORMANCE RATINGS	
Visible Transmittance 0.51	Air Leakage (U.S./I-P) 0.2
<small>Manufacturer stipulates that these ratings conform to applicable NFRC procedures for determining whole product performance. NFRC ratings are determined for a fixed set of environmental conditions and a specific product size. Consult manufacturer's literature for other product performance information. www.nfrc.org</small>	

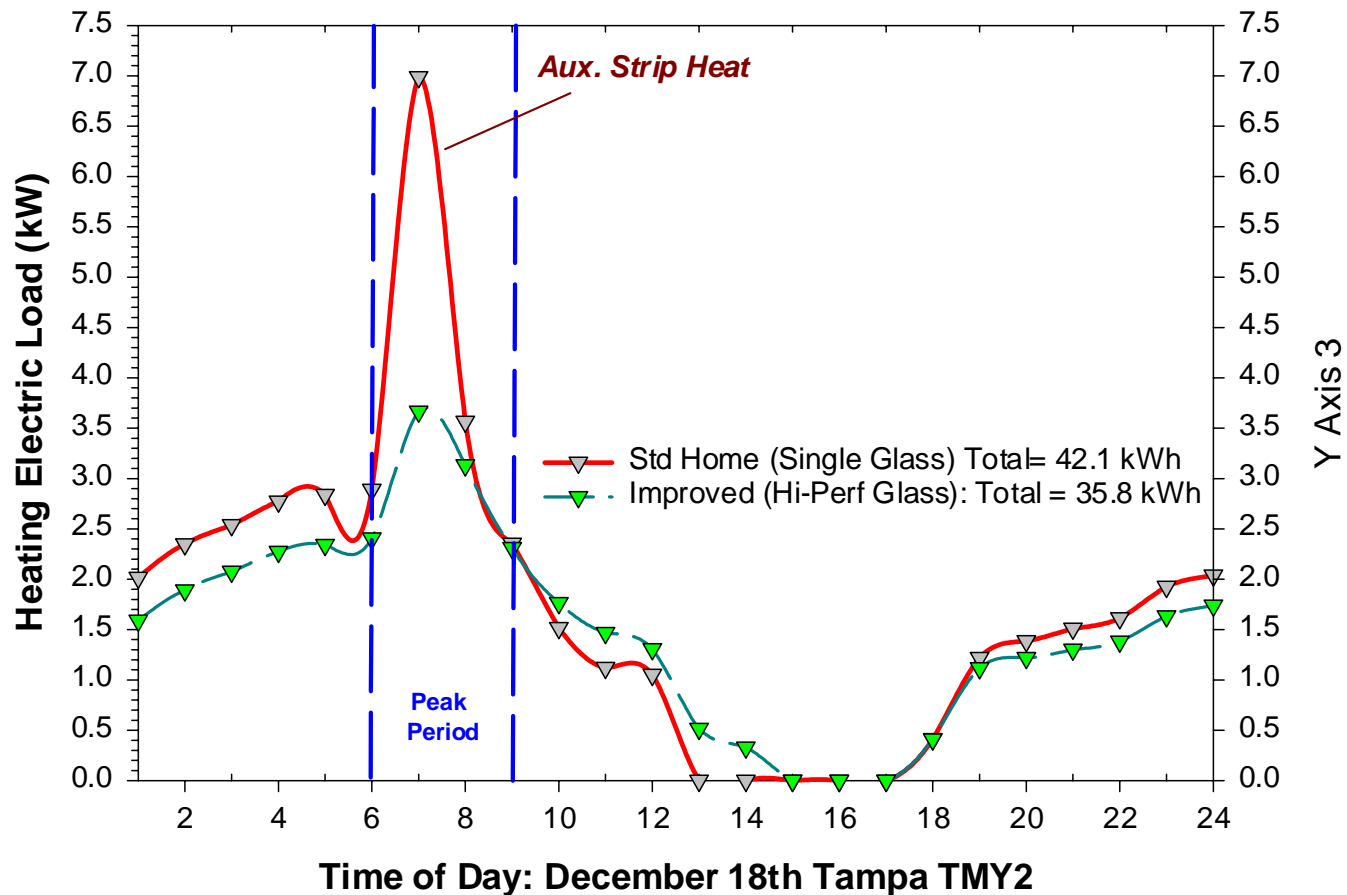

Simulated AC demand on peak cooling day

Simulated impact of generic high performance solar control window on peak heating day for Tampa Dec. 18th

Parameters Studied

- ❖ Efficient Windows (experimental & simulated)
- ❖ **Various Efficiency Measures (simulated)**
- ❖ Duct Leakage (experimental)
- ❖ HVAC Operations (experimental)
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ Internal Loads

Efficiency Measures vs. RH for Simulated Tampa Home

❖ Case	CoolingkWh	HeatingkWh	Avg RH%
Standard Building:	5958	585	48.4%
❖ Low-E solar windows	4213	292	51.3%
❖ White Roof	5186	595	49.3%
❖ 100% CFL Lighting	5602	625	48.7%
❖ Reduce Infiltration	5517	481	46.1%

FSEC EnergyGauge USA analysis, 2007

Parameters Studied

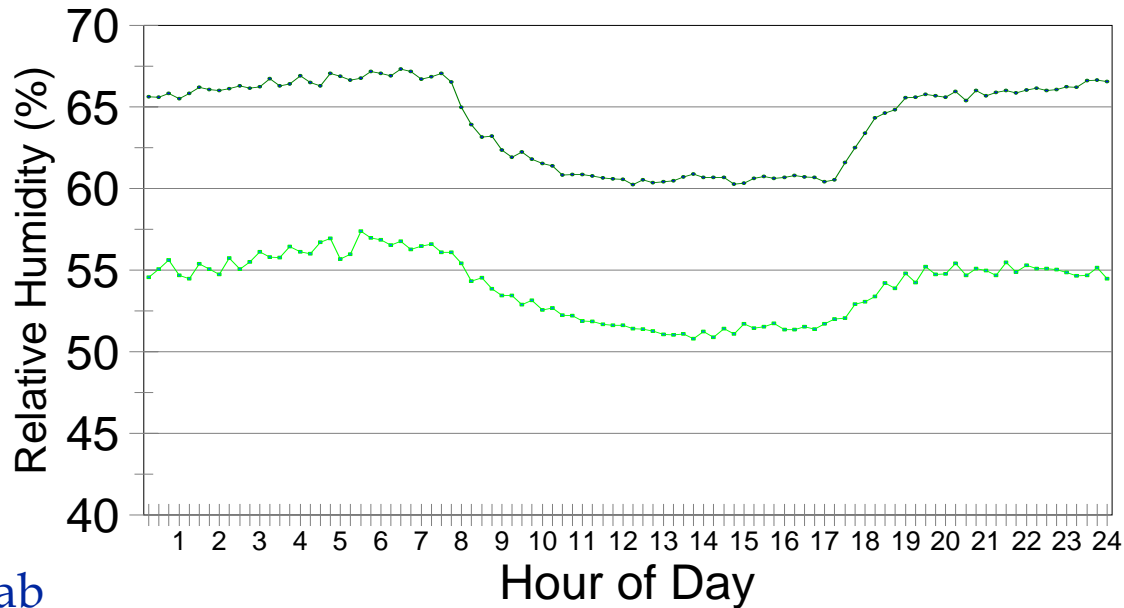

- ❖ Efficient Windows (experimental & simulated)
- ❖ Various Efficiency Measures (simulated)
- ❖ **Duct Leakage (experimental)**
- ❖ HVAC Operations (experimental)
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ Internal Loads

Impact of Duct Leakage - FSEC lab experiment

Relative Humidity in Room
with duct leakage in vented attic

FSEC Lab
Attic with steel
joists, good connection
to conditioned space

— No Leak

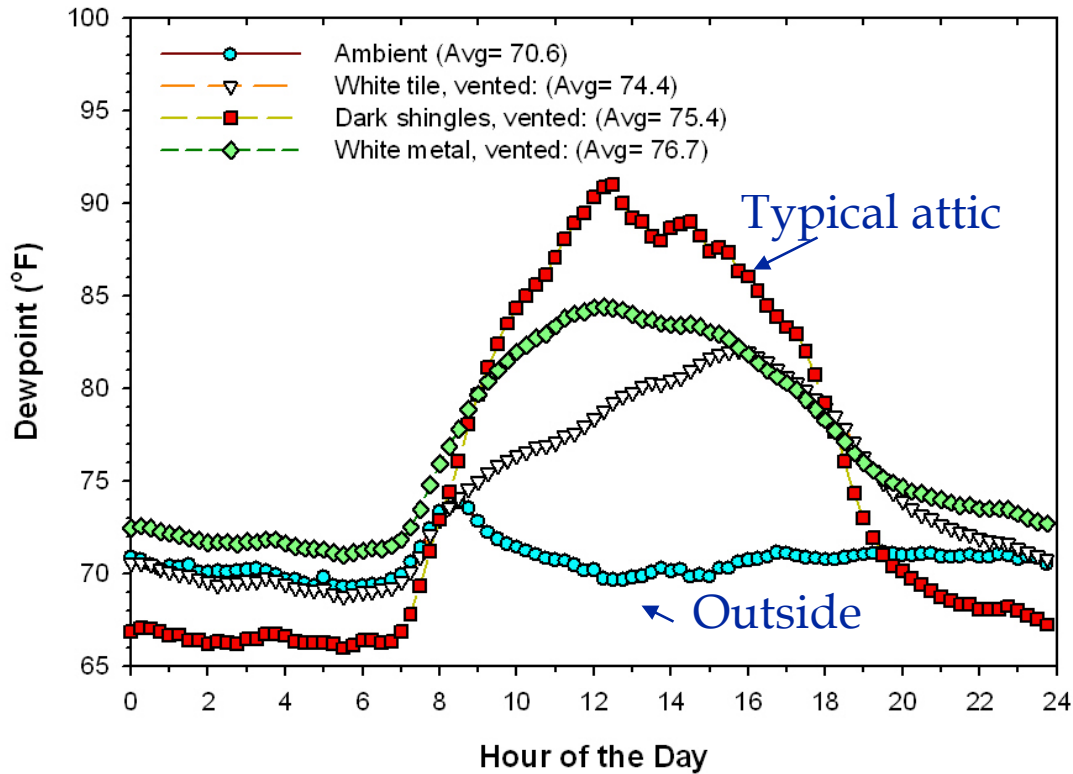

— 0%RL, 30% SL

Attic Dew Point

Measured Average Mid-attic Dewpoints
FRF: August 2000

Parameters Studied

- ❖ Efficient Windows (experimental & simulated)
- ❖ Various Efficiency Measures (simulated)
- ❖ Duct Leakage (experimental)
- ❖ **HVAC Operations (experimental)**
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ Internal Loads

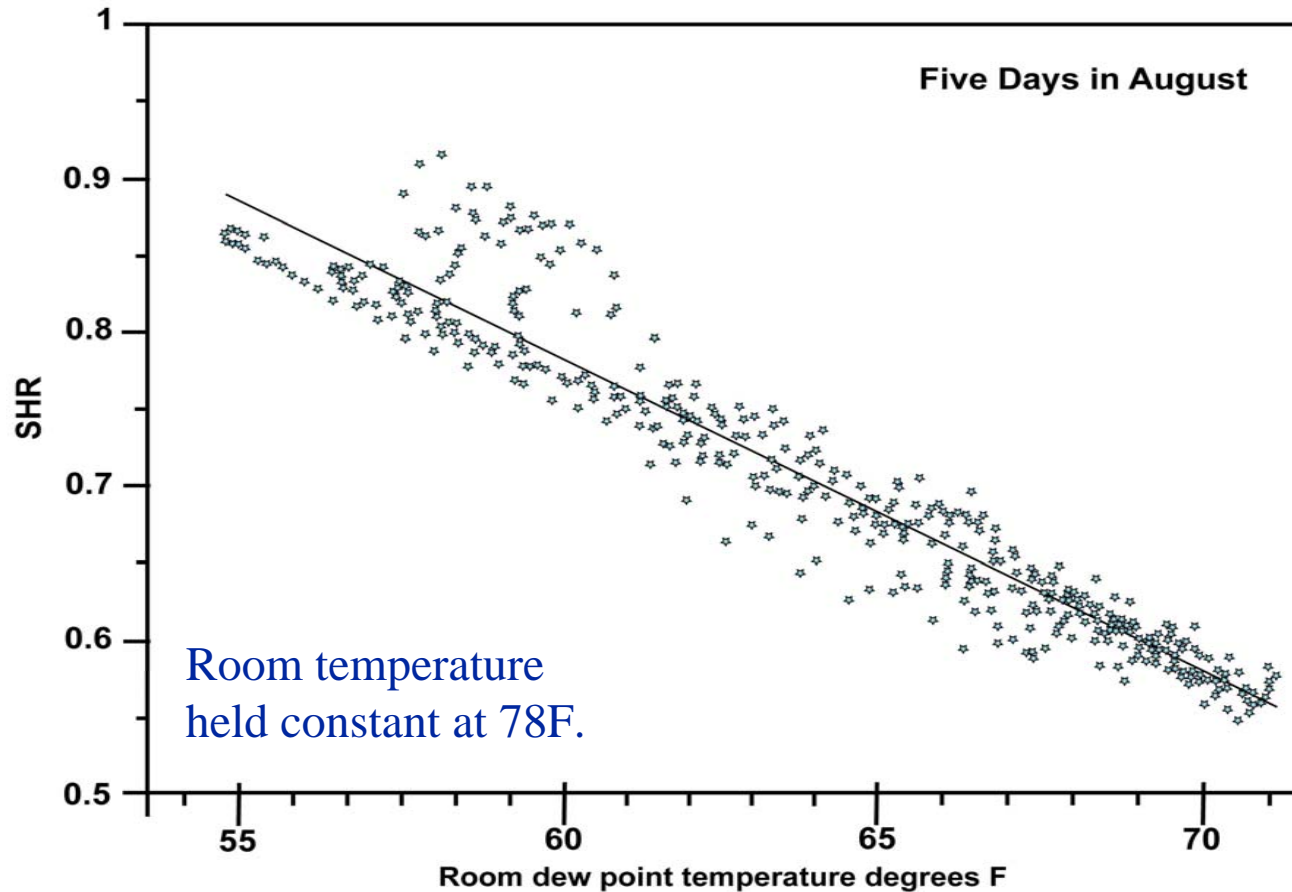

Cooling Equipment

- ❖ Rated sensible heat ratio (SHR) is about 75%
- ❖ Latent heat ratio (LHR) is about 25%
- ❖ However, LHR increases
 - With higher room humidity
 - With lower system air flow rates

Measured SHR as a Function of Room Dew Point Temperature

RH Maintained Even with Mechanical Ventilation

- ❖ Automatic simulation of sensible and latent occupancy loads.
- ❖ 6 ventilation strategies
- ❖ Cooling set point 75F, A/C adequate to maintain RH below 60% for all strategies examined.

Case 4 uses ~15% more energy than case 6

Strategies
No mechanical ventilation
Spot ventilation
Outside air
OA - 10/20 cycle - Dehumidification
OA - 10/20 cycle
Energy recovery ventilator
OA - Humidistat

SEER and latent removal are independent at steady state

“We conclude that the latent removal of small unitary equipment is not a function of efficiency.

Furthermore, the latent removal characteristics of this type of equipment have not changed significantly over time...”

David Godwin, “Latent Capacity of Unitary Equipment,” ASHRAE TO-98-9-2

Parameters Studied

- ❖ Efficient Windows (experimental & simulated)
- ❖ Various Efficiency Measures (simulated)
- ❖ Duct Leakage (experimental)
- ❖ HVAC Operations (experimental)
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ Internal Loads

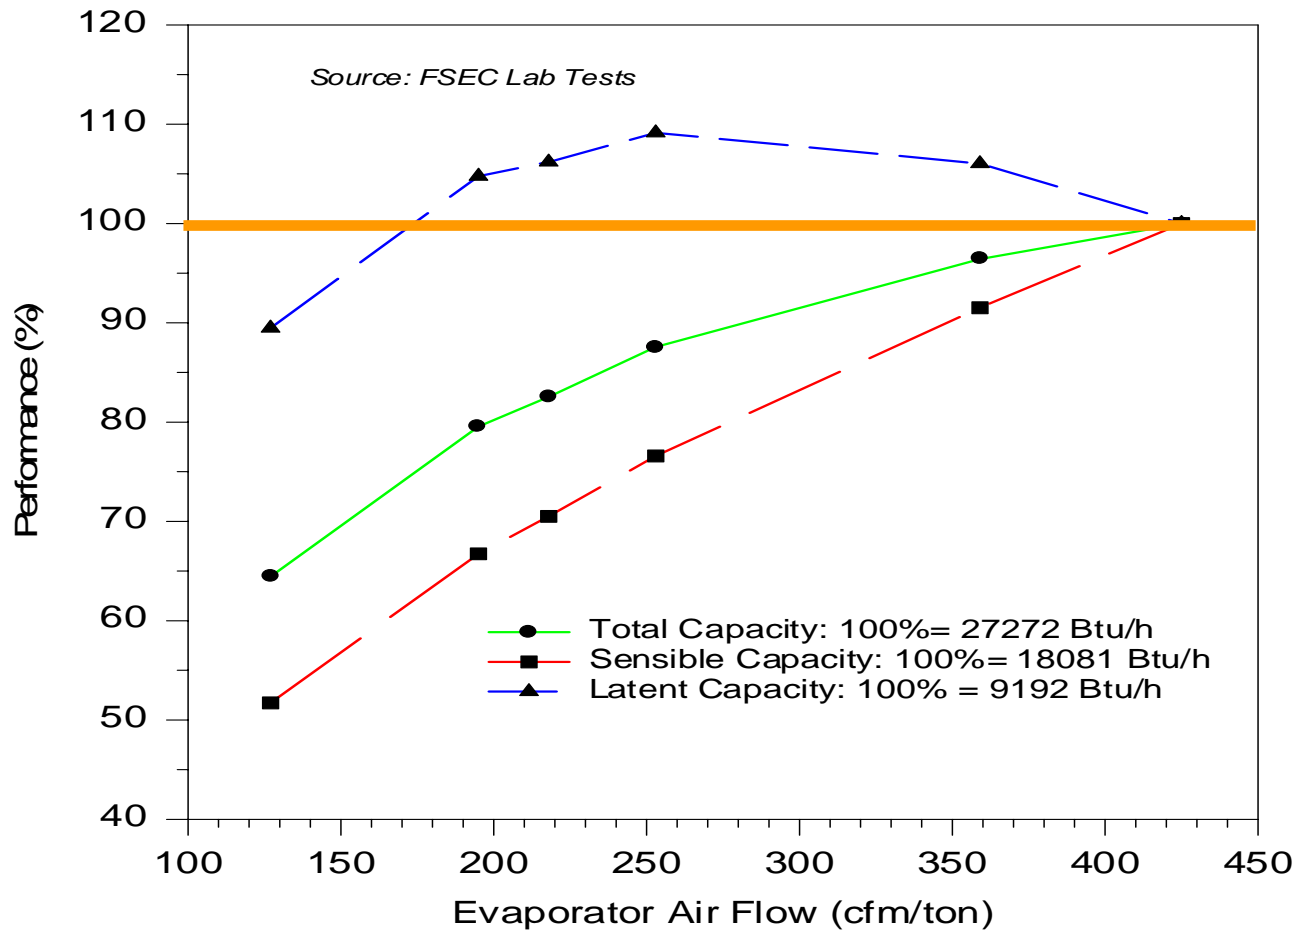

Optimization of Latent vs Sensible Cooling

- ❖ During hot and humid weather, there is a sensible cooling load and a latent cooling load.
 - A high air flow rate will produce the highest sensible cooling efficiency.
 - A lower air flow rate will produce the highest latent cooling efficiency.

Impact of Air Flow

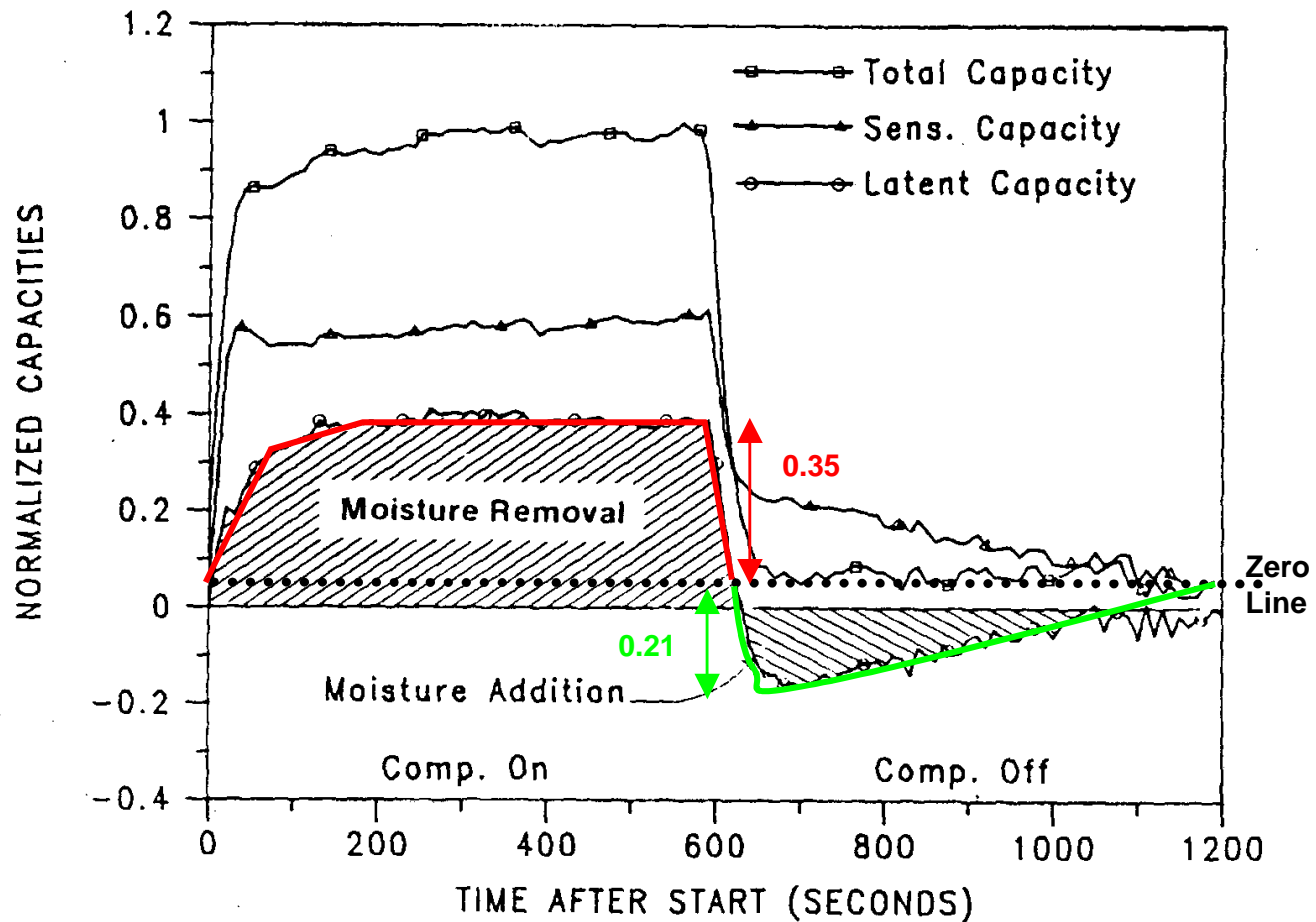

Field Data: Latent Performance Fan "Auto" vs. "On"

FSEC Data - Continuous Fan

(Khattar)

Parameters Studied

- ❖ Efficient Windows (experimental & simulated)
- ❖ Various Efficiency Measures (simulated)
- ❖ Duct Leakage (experimental)
- ❖ HVAC Operations (experimental)
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ Internal Loads

Time Delay - Lab Results

Wet-coil: 80F air inlet, 60.4F dew point

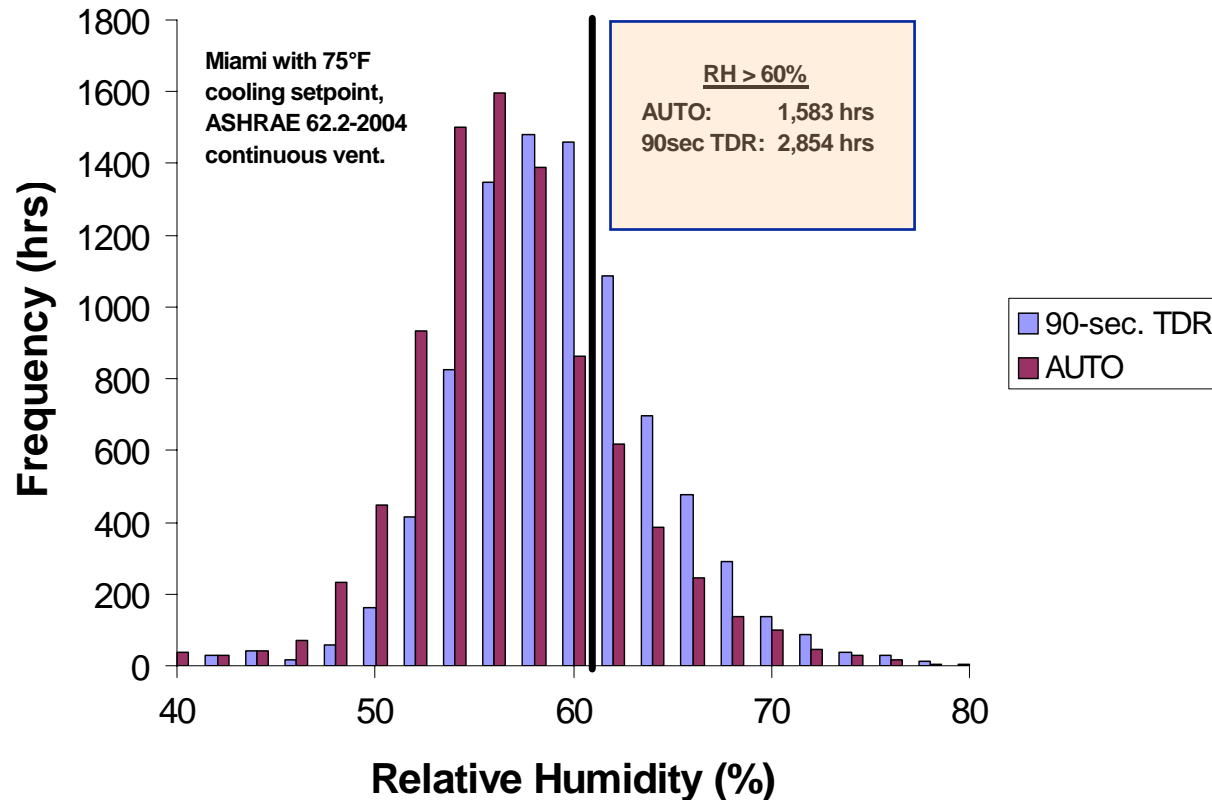

Fan Operation	Gross EER (Btu/Wh)	Net EER considers fan heat and power (Btu/Wh)
Auto, no overrun	11.15	9.47
90 second overrun	11.09 (-1%)	9.10(-4%)

Time Delay Relay - simulated

Indoor Humidity - AUTO Fan vs 90-sec Overrun

Notes: Mechanical ventilation simulated into space not coil.

Used TRN-ResDH, a TRNSYS-based hour-by-hour building energy simulation tool

Shirey, D.B., H.I. Henderson and R.A. Raustad. 2006.

Understanding the Dehumidification Performance of Air-Conditioning Equipment at Part-Load Conditions. Final Report, FSEC-CR-1537-05

Parameters Studied

- ❖ Efficient Windows (experimental & simulated)
- ❖ Various Efficiency Measures (simulated)
- ❖ Duct Leakage (experimental)
- ❖ HVAC Operations (experimental)
- ❖ HVAC Flow and Fan Operation (experimental)
- ❖ HVAC Time Delay Relay (experimental and simulated)
- ❖ **Internal Loads**

Growth in Consumer Electronics Will Increase Sensible Heat Load

Figure US-1. Electricity Consumption by End Use in U.S. Households, 2001

Notes: "Share of total" is the share of total electricity consumption by U.S. households. "HVAC Appliances" consists of furnace fan, ceiling fan, dehumidifier, humidifier, and evaporative cooler (swamp cooler). "Other Equipment" consists of pool filter/pump, hot tub/spa/pool heater, waterbed heater, and well water pump. "Other End Use" includes many end uses not specifically listed.

Sources: EIA, Residential Energy Consumption Survey 2001, Forms EIA-457A-C, E, and H and other sources (see Table US-1).

Figure US-4. Electronic Equipment Electricity Consumption in U.S. Households, 2001

U.S. Total: 82 Billion kWh

Note: Totals may not equal sum of components due to independent rounding.

Sources: EIA, Residential Energy Consumption Survey 2001, Forms EIA-457A-C, E, and H and other sources (see Table US-1).

- ❖ EIA projects electricity consumption to grow 3.5 percent annually for color TVs and computer equipment through 2025, to more than double the level of consumption in 2003.

Conclusions

- ❖ More efficient windows or other envelope measures can reduce sensible loads and save energy, with slight increases in RH in typical single-family homes
- ❖ Duct leakage, time delay relay and fan speed settings of HVAC equipment can have moderate to large effect on ability of equipment to remove moisture
- ❖ Fan set to continuous “on” mode greatly reduces moisture removal
- ❖ Plug loads (sensible heat) are increasing and may counter some reductions in sensible heat from envelope improvements
